Independence

Matroids

Composition of non-decreasting submodular and non-decreasing concave

Theorem 5.3.1

Given two functions, one defined on sets

$$f: 2^V \to \mathbb{R} \tag{5.1}$$

and another continuous valued one:

$$g: \mathbb{R} \to \mathbb{R} \tag{5.2}$$

the composition formed as $h = g \circ f : 2^V \to \mathbb{R}$ (defined as h(S) = g(f(S))) is nondecreasing submodular, if g is non-decreasing concave and f is nondecreasing submodular.

Examples and Properties

Other Submodular Defs.

Independence

Matroids

Monotone difference of two functions

Let f and g both be submodular functions on subsets of V and let $(f-g)(\cdot)$ be either monotone increasing or monotone decreasing. Then $h:2^V\to R$ defined by

$$h(A) = \min(f(A), g(A)) \tag{5.3}$$

is submodular.

Proof.If h(A) agrees with f on both X and Y (or g on both X and Y), and since $f(X) + f(Y) \ge f(X \cup Y) + f(X \cap Y)$ $g(X) + g(Y) \ge g(X \cup Y) + g(X \cap Y)$,(5.5)

the result (Equation 5.3 being submodular) follows since

$$\frac{f(X) + f(Y)}{g(X) + g(Y)} \ge \min(f(X \cup Y), g(X \cup Y)) + \min(f(X \cap Y), g(X \cap Y))$$
(5.6)

Examples and Properties

Other Submodular Defs.

Independence

Matroids

Monotone difference of two functions

...cont.

Otherwise, w.l.o.g.,
$$h(X) = f(X)$$
 and $h(Y) = g(Y)$, giving

$$h(X) + h(Y) = f(X) + g(Y) \ge f(X \cup Y) + f(X \cap Y) + g(Y) - f(Y)$$
(5.7)

Examples and Properties	Other Submodular Defs.	Independence	Matroids
Monotone dif	ference of two fund	ctions	

...cont.

Otherwise, w.l.o.g.,
$$h(X) = f(X)$$
 and $h(Y) = g(Y)$, giving

$$h(X) + h(Y) = f(X) + g(Y) \ge f(X \cup Y) + f(X \cap Y) + g(Y) - f(Y)$$
(5.7)

Assume the case where f-g is monotone increasing. Hence, $f(X\cup Y)+g(Y)-f(Y)\geq g(X\cup Y)$ giving

$$h(X) + h(Y) \ge g(X \cup Y) + f(X \cap Y) \ge h(X \cup Y) + h(X \cap Y)$$
 (5.8)

What is an easy way to prove the case where f - g is monotone decreasing?

Prof. Jeff Bilmes

Let $f: 2^V \to \mathbb{R}$ be an monotone increasing or decreasing submodular function and let k be a constant. Then the function $h: 2^V \to \mathbb{R}$ defined by

$$h(A) = \min(k, f(A)) \tag{5.9}$$

is submodular.

Let $f: 2^V \to \mathbb{R}$ be an monotone increasing or decreasing submodular function and let k be a constant. Then the function $h: 2^V \to \mathbb{R}$ defined by

$$h(A) = \min(k, f(A))$$
(5.9)

is submodular.

Proof.

For constant k, we have that (f - k) is increasing (or decreasing) so this follows from the previous result.

Let $f: 2^V \to \mathbb{R}$ be an monotone increasing or decreasing submodular function and let k be a constant. Then the function $h: 2^V \to \mathbb{R}$ defined by

$$h(A) = \min(k, f(A))$$
(5.9)

is submodular.

Proof.

For constant k, we have that (f - k) is increasing (or decreasing) so this follows from the previous result.

Note also, $g(a) = \min(k, a)$ for constant k is a non-decreasing concave function, so when f is monotone nondecreasing submodular, we can use the earlier result about composing a monotone concave function with a monotone submodular function to get a version of this.

Examples and Properties	Other Submodular Defs.	Independence	
More on Min - t	he saturate trick		

• In general, the minimum of two submodular functions is not submodular (unlike concave functions, closed under min).

Examples and Properties	Other Submodular Defs.	Independence	
More on Min	- the saturate trick		

- In general, the minimum of two submodular functions is not submodular (unlike concave functions, closed under min).
- However, when wishing to maximize two monotone non-decreasing submodular functions f, g, we can define function $h_{\alpha} : 2^V \to \mathbb{R}$ as

$$h_{\alpha}(A) = \frac{1}{2} \left(\min(\alpha, f(A)) + \min(\alpha, g(A)) \right)$$
(5.10)

then h_{α} is submodular, and $h_{\alpha}(A) \geq \alpha$ if and only if both $f(A) \geq \alpha$ and $g(A) \geq \alpha$, for constant $\alpha \in \mathbb{R}$.

Examples and Properties	Other Submodular Defs.	Independence	
More on Min	- the saturate trick		

- In general, the minimum of two submodular functions is not submodular (unlike concave functions, closed under min).
- However, when wishing to maximize two monotone non-decreasing submodular functions f, g, we can define function $h_{\alpha} : 2^V \to \mathbb{R}$ as

$$h_{\alpha}(A) = \frac{1}{2} \left(\min(\alpha, f(A)) + \min(\alpha, g(A)) \right)$$
(5.10)

then h_{α} is submodular, and $h_{\alpha}(A) \geq \alpha$ if and only if both $f(A) \geq \alpha$ and $g(A) \geq \alpha$, for constant $\alpha \in \mathbb{R}$.

• This can be useful in many applications. An instance of a <u>submodular</u> <u>surrogate</u> (where we take a non-submodular problem and find a submodular one that can tell us something about it).

Examples and Properties		r Submodular Defs.		e Matroids
Arbitrary funcs.	functions	as difference	between	submodular

Given an arbitrary set function h, it can be expressed as a difference between two submodular functions (i.e., $\exists f, g \text{ s.t. } \forall A, h(A) = f(A) - g(A)$ where both f and g are submodular).

Proof.

Let h be given and arbitrary, and define:

$$\alpha \stackrel{\Delta}{=} \min_{X,Y} \left(h(X) + h(Y) - h(X \cup Y) - h(X \cap Y) \right)$$
(5.11)

If $\alpha \geq 0$ then h is submodular, so by assumption $\alpha < 0$.

Examples and Properties	Other Submodular Defs.		Matroids
Arbitrary funcs.	functions as difference	between	submodular

Given an arbitrary set function h, it can be expressed as a difference between two submodular functions (i.e., $\exists f, g \text{ s.t. } \forall A, h(A) = f(A) - g(A)$ where both f and g are submodular).

Proof.

Let h be given and arbitrary, and define:

$$\alpha \stackrel{\Delta}{=} \min_{X,Y} \left(h(X) + h(Y) - h(X \cup Y) - h(X \cap Y) \right)$$
(5.11)

If $\alpha\geq 0$ then h is submodular, so by assumption $\alpha<0.$ Now let f be an arbitrary strict submodular function and define

$$\beta \stackrel{\Delta}{=} \min_{X,Y:X \not\subseteq Y,Y \not\subseteq X} \Big(f(X) + f(Y) - f(X \cup Y) - f(X \cap Y) \Big).$$
(5.12)

Strict means that $\beta > 0$.

- Given arbitrary normalized submodular $g: 2^V \to \mathbb{R}$, construct a function $\bar{g}: 2^V \to \mathbb{R}$ as follows:

$$\bar{g}(A) = g(A) - \sum_{a \in A} g(a|V \setminus \{a\}) = g(A) - m_g(A)$$
 (5.21)

where $m_g(A) \triangleq \sum_{a \in A} g(a|V \setminus \{a\})$ is a modular function. • \overline{g} is normalized since $\overline{g}(\emptyset) = 0$.

Totally normalized functions

- Any normalized submodular function g (even non-monotone) can be represented as a sum of a polymatroid (normalized monotone non-decreasing submodular) function \bar{g} and a modular function m_g .
- Given arbitrary normalized submodular $g: 2^V \to \mathbb{R}$, construct a function $\bar{g}: 2^V \to \mathbb{R}$ as follows:

$$\bar{g}(A) = g(A) - \sum_{a \in A} g(a|V \setminus \{a\}) = g(A) - m_g(A)$$
 (5.21)

where $m_g(A) \triangleq \sum_{a \in A} g(a | V \setminus \{a\})$ is a modular function.

- \bar{g} is normalized since $\bar{g}(\emptyset) = 0$.
- \bar{g} is monotone non-decreasing since for $v \notin A \subseteq V$:

$$\bar{g}(v|A) = g(v|A) - g(v|V \setminus \{a\}) \ge 0$$
(5.22)

Totally normalized functions

- Any normalized submodular function g (even non-monotone) can be represented as a sum of a polymatroid (normalized monotone non-decreasing submodular) function \bar{g} and a modular function m_g .
- Given arbitrary normalized submodular $g: 2^V \to \mathbb{R}$, construct a function $\bar{g}: 2^V \to \mathbb{R}$ as follows:

$$\bar{g}(A) = g(A) - \sum_{a \in A} g(a|V \setminus \{a\}) = g(A) - m_g(A)$$
 (5.21)

where $m_g(A) \triangleq \sum_{a \in A} g(a | V \setminus \{a\})$ is a modular function.

- \bar{g} is normalized since $\bar{g}(\emptyset) = 0$.
- \bar{g} is monotone non-decreasing since for $v \notin A \subseteq V$:

$$\bar{g}(v|A) = g(v|A) - g(v|V \setminus \{a\}) \ge 0$$
(5.22)

• \bar{g} is called the totally normalized version of g.

Totally normalized functions

- Any normalized submodular function g (even non-monotone) can be represented as a sum of a polymatroid (normalized monotone non-decreasing submodular) function \bar{g} and a modular function m_g .
- Given arbitrary normalized submodular $g: 2^V \to \mathbb{R}$, construct a function $\bar{g}: 2^V \to \mathbb{R}$ as follows:

$$\bar{g}(A) = g(A) - \sum_{a \in A} g(a|V \setminus \{a\}) = g(A) - m_g(A)$$
 (5.21)

where $m_g(A) \triangleq \sum_{a \in A} g(a | V \setminus \{a\})$ is a modular function.

- \bar{g} is normalized since $\bar{g}(\emptyset) = 0$.
- \bar{g} is monotone non-decreasing since for $v \notin A \subseteq V$:

$$\bar{g}(v|A) = g(v|A) - g(v|V \setminus \{a\}) \ge 0$$
(5.22)

- \bar{g} is called the totally normalized version of g.
- Then $g(A) = \overline{g}(A) + m_g(A)$.

• Any normalized function h (i.e., $h(\emptyset) = 0$) can be represented as a difference not only between submodular, but between polymatroid (normalized monotone non-decreasing submodular) functions.

- Any normalized function h (i.e., $h(\emptyset) = 0$) can be represented as a difference not only between submodular, but between polymatroid (normalized monotone non-decreasing submodular) functions.
- Given submodular f and g, let \overline{f} and \overline{g} be them totally normalized.

- Any normalized function h (i.e., $h(\emptyset) = 0$) can be represented as a difference not only between submodular, but between polymatroid (normalized monotone non-decreasing submodular) functions.
- Given submodular f and g, let \overline{f} and \overline{g} be them totally normalized.
- Given arbitrary h = f g where f and g are normalized submodular,

$$h = f - g = \bar{f} + m_f - (\bar{g} + m_g)$$
(5.23)

$$=\bar{f}-\bar{g}+(m_f-m_g)$$
(5.24)

$$= \bar{f} - \bar{g} + m_{f-h}$$
 (5.25)

$$=\bar{f} + m_{f-g}^{+} - (\bar{h} + (-m_{f-g})^{+})$$
(5.26)

where m^+ is the positive part of modular function m. That is, $m^+(A) = \sum_{a \in A} m(a) \mathbf{1}(m(a) > 0).$

- Any normalized function h (i.e., $h(\emptyset) = 0$) can be represented as a difference not only between submodular, but between polymatroid (normalized monotone non-decreasing submodular) functions.
- Given submodular f and g, let \overline{f} and \overline{g} be them totally normalized.
- Given arbitrary h = f g where f and g are normalized submodular,

$$h = f - g = \bar{f} + m_f - (\bar{g} + m_g)$$
(5.23)

$$=\bar{f}-\bar{g}+(m_f-m_g)$$
(5.24)

$$= \bar{f} - \bar{g} + m_{f-h}$$
 (5.25)

$$=\bar{f}+m_{f-g}^{+}-(\bar{h}+(-m_{f-g})^{+})$$
(5.26)

where m^+ is the positive part of modular function m. That is, $m^+(A) = \sum_{a \in A} m(a) \mathbf{1}(m(a) > 0).$ • Both $f + m_{f-g}^+$ and $\bar{g} + (-m_{f-g})^+$ are polymatroid functions!

- Any normalized function h (i.e., $h(\emptyset) = 0$) can be represented as a difference not only between submodular, but between polymatroid (normalized monotone non-decreasing submodular) functions.
- Given submodular f and g, let \overline{f} and \overline{g} be them totally normalized.
- Given arbitrary h = f g where f and g are normalized submodular,

$$h = f - g = \bar{f} + m_f - (\bar{g} + m_g)$$
(5.23)

$$=\bar{f}-\bar{g}+(m_f-m_g)$$
(5.24)

$$=ar{f} - ar{g} + m_{f-h}$$
 (5.25)

$$=\bar{f}+m_{f-g}^{+}-(\bar{h}+(-m_{f-g})^{+})$$
(5.26)

where m^+ is the positive part of modular function m. That is, $m^+(A) = \sum_{a \in A} m(a) \mathbf{1}(m(a) > 0).$

- Both $f + m_{f-g}^+$ and $\bar{g} + (-m_{f-g})^+$ are polymatroid functions!
- Thus, any function can be expressed as a difference between two, not only submodular (DS), but polymatroid functions.

Prof. Jeff Bilmes

Independence

Matroids

Two Equivalent Submodular Definitions

Definition 5.4.1 (submodular concave)

A function $f: 2^V \to \mathbb{R}$ is submodular if for any $A, B \subseteq V$, we have that:

$$f(A) + f(B) \ge f(A \cup B) + f(A \cap B)$$
(5.8)

An alternate and (as we will soon see) equivalent definition is:

Definition 5.4.2 (diminishing returns)

A function $f: 2^V \to \mathbb{R}$ is submodular if for any $A \subseteq B \subset V$, and $v \in V \setminus B$, we have that:

$$f(A \cup \{v\}) - f(A) \ge f(B \cup \{v\}) - f(B)$$
(5.9)

The incremental "value", "gain", or "cost" of v decreases (diminishes) as the context in which v is considered grows from A to B.

Submodular	Definition:	Group	Diminishing	Returns

An alternate and equivalent definition is:

Definition 5.4.1 (group diminishing returns)

A function $f: 2^V \to \mathbb{R}$ is submodular if for any $A \subseteq B \subset V$, and $C \subseteq V \setminus B$, we have that:

$$f(A \cup C) - f(A) \ge f(B \cup C) - f(B)$$
 (5.27)

This means that the incremental "value" or "gain" of set C decreases as the context in which C is considered grows from A to B (diminishing returns)

Other Submodular Defs.

Independence

Matroids

Submodular Definition Basic Equivalencies

We want to show that Submodular Concave (Definition 5.4.1), Diminishing Returns (Definition 5.4.2), and Group Diminishing Returns (Definition 5.4.1) are identical.

Other Submodular Defs.

Independence

Matroids

Submodular Definition Basic Equivalencies

We want to show that Submodular Concave (Definition 5.4.1), Diminishing Returns (Definition 5.4.2), and Group Diminishing Returns (Definition 5.4.1) are identical. We will show that:

- Submodular Concave \Rightarrow Diminishing Returns
- Diminishing Returns \Rightarrow Group Diminishing Returns
- Group Diminishing Returns \Rightarrow Submodular Concave

Other Submodular Defs.

Independence

Matroids

Submodular Concave ⇒ Diminishing Returns

$f(S) + f(T) \ge f(S \cup T) + f(S \cap T) \Rightarrow f(v|A) \ge f(v|B), A \subseteq B \subseteq V \setminus v.$

• Assume Submodular concave, so $\forall S, T$ we have $f(S) + f(T) \ge f(S \cup T) + f(S \cap T).$

Other Submodular Defs.

Independence

Matroids

Submodular Concave ⇒ Diminishing Returns

$f(S) + f(T) \ge f(S \cup T) + f(S \cap T) \Rightarrow f(v|A) \ge f(v|B), A \subseteq B \subseteq V \setminus v.$

- Assume Submodular concave, so $\forall S, T$ we have $f(S) + f(T) \ge f(S \cup T) + f(S \cap T).$
- Given A, B and $v \in V$ such that: $A \subseteq B \subseteq V \setminus \{v\}$, we have from submodular concave that:

$$f(A+v) + f(B) \ge f(B+v) + f(A)$$
 (5.28)

Submodular Concave ⇒ Diminishing Returns

$f(S) + f(T) \ge f(S \cup T) + f(S \cap T) \Rightarrow f(v|A) \ge f(v|B), A \subseteq B \subseteq V \setminus v.$

- Assume Submodular concave, so $\forall S, T$ we have $f(S) + f(T) \ge f(S \cup T) + f(S \cap T).$
- Given A, B and $v \in V$ such that: $A \subseteq B \subseteq V \setminus \{v\}$, we have from submodular concave that:

$$f(A+v) + f(B) \ge f(B+v) + f(A)$$
 (5.28)

• Rearranging, we have

$$f(A+v) - f(A) \ge f(B+v) - f(B)$$
 (5.29)

Diminishing Returns \Rightarrow Group Diminishing Returns

$f(v|S) \ge f(v|T), S \subseteq T \subseteq V \setminus v \Rightarrow f(C|A) \ge f(C|B), A \subseteq B \subseteq V \setminus C.$

Let $C = \{c_1, c_2, \dots, c_k\}$. Then diminishing returns implies

$$f(A \cup C) - f(A) \tag{5.30}$$

$$= f(A \cup C) - \sum_{i=1}^{k-1} \left(f(A \cup \{c_1, \dots, c_i\}) - f(A \cup \{c_1, \dots, c_i\}) \right) - f(A)$$
(5.31)

$$=\sum_{i=1}^{k} \left(f(A \cup \{c_1 \dots c_i\}) - f(A \cup \{c_1 \dots c_{i-1}\}) \right)$$
(5.32)

$$\geq \sum_{i=1}^{\kappa} \left(f(B \cup \{c_1 \dots c_i\}) - f(B \cup \{c_1 \dots c_{i-1}\}) \right)$$
(5.33)

$$= f(B \cup C) - \sum_{i=1}^{k-1} \left(f(B \cup \{c_1, \dots, c_i\}) - f(B \cup \{c_1, \dots, c_i\}) \right) - f(B)$$
(5.34)

$$= f(B \cup C) - f(B)$$
 (5.35)

Group Diminishing Returns \Rightarrow Submodular Concave

$f(U|S) \geq f(U|T), S \subseteq T \subseteq V \setminus U \Rightarrow f(A) + f(B) \geq f(A \cup B) + f(A \cap B).$

Assume group diminishing returns. Assume $A \neq B$ otherwise trivial. Define $A' = A \cap B$, $C = A \setminus B$, and B' = B. Then since $A' \subseteq B'$,

$$f(A'+C) - f(A') \ge f(B'+C) - f(B')$$
(5.36)

giving

$$f(A'+C) + f(B') \ge f(B'+C) + f(A')$$
(5.37)

or

$$f(A \cap B + A \setminus B) + f(B) \ge f(B + A \setminus B) + f(A \cap B)$$
(5.38)

which is the same as the submodular concave condition

$$f(A) + f(B) \ge f(A \cup B) + f(A \cap B)$$
 (5.39)

Examples and Properties Other Submodular Defs. Independence Matroids

Eq. 5.54 \Rightarrow Eq. 5.56

Let $T \setminus S = \{j_1, \dots, j_r\}$ and $S \setminus T = \{k_1, \dots, k_q\}$. First, we upper bound the gain of T in the context of S:

$$f(S \cup T) - f(S) = \sum_{t=1}^{r} \left(f(S \cup \{j_1, \dots, j_t\}) - f(S \cup \{j_1, \dots, j_{t-1}\}) \right)$$
(5.64)

$$= \sum_{t=1}^{r} f(j_t | S \cup \{j_1, \dots, j_{t-1}\}) \le \sum_{t=1}^{r} f(j_t | S)$$
(5.65)
$$= \sum_{j \in T \setminus S} f(j | S)$$
(5.66)

or

$$f(T|S) \le \sum_{j \in T \setminus S} f(j|S)$$
(5.67)

Examples and Properties	Other Submodular Defs.	Independence	
Ea. 5.54 ⇒	Eq. 5.56		

Let $T \setminus S = \{j_1, \dots, j_r\}$ and $S \setminus T = \{k_1, \dots, k_q\}$. Next, lower bound S in the context of T:

$$f(S \cup T) - f(T) = \sum_{t=1}^{q} \left[f(T \cup \{k_1, \dots, k_t\}) - f(T \cup \{k_1, \dots, k_{t-1}\}) \right]$$
(5.68)
$$= \sum_{t=1}^{q} f(k_t | T \cup \{k_1, \dots, k_t\} \setminus \{k_t\}) \ge \sum_{t=1}^{q} f(k_t | T \cup S \setminus \{k_t\})$$
(5.69)
$$= \sum_{j \in S \setminus T} f(j | S \cup T \setminus \{j\})$$
(5.70)

Examples and PropertiesOther Submodular Defs.IndependenceMatroidsEq. $5.54 \Rightarrow$ Eq. 5.56

Let $T \setminus S = \{j_1, \dots, j_r\}$ and $S \setminus T = \{k_1, \dots, k_q\}$. So we have the upper bound

$$f(T|S) = f(S \cup T) - f(S) \le \sum_{j \in T \setminus S} f(j|S)$$
(5.71)

and the lower bound

$$f(S|T) = f(S \cup T) - f(T) \ge \sum_{j \in S \setminus T} f(j|S \cup T \setminus \{j\})$$
(5.72)

This gives upper and lower bounds of the form

$$f(T) + \text{lower bound} \le f(S \cup T) \le f(S) + \text{upper bound},$$
 (5.73)

and combining directly the left and right hand side gives the desired inequality.

Prof. Jeff Bilmes

Examples and Properties	Other Submodular Defs.	Independence	
Eq. 5.56 \Rightarrow Eq	. 5.57		

This follows immediately since if $S\subseteq T$, then $S\setminus T=\emptyset$, and the last term of Eq. 5.56 vanishes.

Examples and Properties	Other Submodular Defs.	Independence	
Ea. 5.57 =	⇒ Ea. 5.54		

Here, we set $T=S\cup\{j,k\},\, j\notin S\cup\{k\}$ into Eq. 5.57 to obtain

$$f(S \cup \{j,k\}) \le f(S) + f(j|S) + f(k|S)$$

$$= f(S) + f(S + \{j\}) - f(S) + f(S + \{k\}) - f(S)$$

$$= f(S + \{j\}) + f(S + \{k\}) - f(S)$$

$$= f(j|S) + f(S + \{k\})$$
(5.77)

giving

$$f(j|S \cup \{k\}) = f(S \cup \{j,k\}) - f(S \cup \{k\})$$

$$\leq f(j|S)$$
(5.78)
(5.79)

- A continuous twice differentiable function $f : \mathbb{R}^n \to \mathbb{R}$ is concave iff $\nabla^2 f \preceq 0$ (the Hessian matrix is nonpositive definite).
- Define a "discrete derivative" or difference operator defined on discrete functions $f: 2^V \to \mathbb{R}$ as follows:

$$(\nabla_B f)(A) \triangleq f(A \cup B) - f(A \setminus B) = f(B|(A \setminus B))$$
(5.80)

read as: the derivative of f at A in the direction B.

Examples and Properties	Other Submodular Defs.	Independence	

- Why do we call the f(A) + f(B) ≥ f(A ∪ B) + f(A ∩ B) definition of submodularity, submodular concave?
- A continuous twice differentiable function $f : \mathbb{R}^n \to \mathbb{R}$ is concave iff $\nabla^2 f \preceq 0$ (the Hessian matrix is nonpositive definite).
- Define a "discrete derivative" or difference operator defined on discrete functions $f: 2^V \to \mathbb{R}$ as follows:

$$(\nabla_B f)(A) \triangleq f(A \cup B) - f(A \setminus B) = f(B|(A \setminus B))$$
(5.80)

read as: the derivative of f at A in the direction B.

• Hence, if $A \cap B = \emptyset$, then $(\nabla_B f)(A) = f(B|A)$.

Examples and Properties	Other Submodular Defs.	Independence	

- Why do we call the f(A) + f(B) ≥ f(A ∪ B) + f(A ∩ B) definition of submodularity, submodular concave?
- A continuous twice differentiable function $f : \mathbb{R}^n \to \mathbb{R}$ is concave iff $\nabla^2 f \preceq 0$ (the Hessian matrix is nonpositive definite).
- Define a "discrete derivative" or difference operator defined on discrete functions $f: 2^V \to \mathbb{R}$ as follows:

$$(\nabla_B f)(A) \triangleq f(A \cup B) - f(A \setminus B) = f(B|(A \setminus B))$$
(5.80)

read as: the derivative of f at A in the direction B.

- Hence, if $A \cap B = \emptyset$, then $(\nabla_B f)(A) = f(B|A)$.
- Consider a form of second derivative or 2nd difference: $(\nabla_B f)(A)$

$$(\nabla_C \nabla_B f)(A) = \nabla_C [\overbrace{f(A \cup B)}^{\bullet} - \overbrace{f(A \setminus B)}^{\bullet}]$$
(5.81)

$$= (\nabla_B f)(A \cup C) - (\nabla_B f)(A \setminus C)$$

$$= f(A \cup B \cup C) - f((A \cup C) \setminus B)$$
(5.82)

$$-f((A \setminus C) \cup B) + f((A \setminus C) \setminus B)$$
(5.83)

EE596b/Spring 2016/Submodularity - Lecture 5 - Apr 11th, 2016 F36/64 (pg.85/183)

Examples and Properties	Other Submodular Defs.	Independence	
Submodular	Concave		

$$f(A \cup B \cup C) - f((A \cup C) \setminus B) - f((A \setminus C) \cup B) + f(A \setminus C \setminus B) \le 0$$
(5.84)

Examples and Properties	Other Submodular Defs.	Independence	
Submodular	Concave		

$$f(A \cup B \cup C) - f((A \cup C) \setminus B) - f((A \setminus C) \cup B) + f(A \setminus C \setminus B) \le 0$$
(5.84)

then we have the equation:

 $f((A \cup C) \setminus B) + f((A \setminus C) \cup B) \ge f(A \cup B \cup C) + f(A \setminus C \setminus B)$ (5.85)

Examples and Properties	Other Submodular Defs.	Independence	
Submodular	Concave		

$$f(A \cup B \cup C) - f((A \cup C) \setminus B) - f((A \setminus C) \cup B) + f(A \setminus C \setminus B) \le 0$$
(5.84)

then we have the equation:

$$f((A \cup C) \setminus B) + f((A \setminus C) \cup B) \ge f(A \cup B \cup C) + f(A \setminus C \setminus B)$$
(5.85)

• Define $A' = (A \cup C) \setminus B$ and $B' = (A \setminus C) \cup B$. Then the above implies:

$$f(A') + f(B') \ge f(A' \cup B') + f(A' \cap B')$$
(5.86)

and note that A' and B' so defined can be arbitrary.

(5.93)

• maxInd: Inclusionwise maximal independent subsets (or bases) of any set $B \subseteq V$.

 $\mathsf{maxInd}(B) \triangleq \{A \subseteq B : A \in \mathcal{I} \text{ and } \forall v \in B \setminus A, A \cup \{v\} \notin \mathcal{I}\}$ (5.94)

 Given any set B ⊂ V of vectors, all maximal (by set inclusion) subsets of linearly independent vectors are the same size. That is, for all B ⊆ V,

$$\forall A_1, A_2 \in \mathsf{maxInd}(B), \quad |A_1| = |A_2| \tag{5.95}$$

Examples and Properties	Other Submodular Defs.	Independence	Matroids
From Matrix	$Rank \rightarrow Matroid$		

• Thus, for all $I \in \mathcal{I}$, the matrix rank function has the property

$$r(I) = |I| \tag{5.96}$$

and for any $B \notin \mathcal{I}$,

 $r(B) = \max\left\{|A| : A \subseteq B \text{ and } A \in \mathcal{I}\right\} \le |B|$ (5.97)

Examples and Properties	Other Submodular Defs.	Independence	Matroids
Matroid			
Matroid			

• Matroids abstract the notion of linear independence of a set of vectors to general algebraic properties.

Examples and Properties	Other Submodular Defs.	Independence	Matroids
Matroid			

- Matroids abstract the notion of linear independence of a set of vectors to general algebraic properties.
- In a matroid, there is an underlying ground set, say E (or V), and a collection of subsets of E that correspond to independent elements.

Examples and Properties	Other Submodular Defs.	Independence	Matroids
Matroid			

- Matroids abstract the notion of linear independence of a set of vectors to general algebraic properties.
- In a matroid, there is an underlying ground set, say E (or V), and a collection of subsets of E that correspond to independent elements.
- There are many definitions of matroids that are mathematically equivalent, we'll see some of them here.

Examples and Properties	Other Submodular Defs.	Independence	Matroids
Independence Sy	rstem		

Definition 5.6.1 (set system)

A (finite) ground set E and a set of subsets of E, $\emptyset \neq \mathcal{I} \subseteq 2^E$ is called a set system, notated (E, \mathcal{I}) .

 Set systems can be arbitrarily complex since, as stated, there is no systematic method (besides exponential-cost exhaustive search) to determine if a given set S ⊆ E has S ∈ I.

Examples and Properties	Other Submodular Defs.	Independence	Matroids
Independence Sy	rstem		

Definition 5.6.1 (set system)

A (finite) ground set E and a set of subsets of E, $\emptyset \neq \mathcal{I} \subseteq 2^E$ is called a set system, notated (E, \mathcal{I}) .

- Set systems can be arbitrarily complex since, as stated, there is no systematic method (besides exponential-cost exhaustive search) to determine if a given set S ⊆ E has S ∈ I.
- One useful property is "heredity." Namely, a set system is a hereditary set system if for any $A \subset B \in \mathcal{I}$, we have that $A \in \mathcal{I}$.

$$\forall I \in \mathcal{I}, J \subset I \Rightarrow J \in \mathcal{I} \quad \text{(subclusive)} \tag{12}$$

• Property I2 is called "down monotone," "down closed," or "subclusive"

Examples and Properties	Other Submodular Defs.	Independence	Matroids
Independence	e System		

Definition 5.6.2 (independence (or hereditary) system)

A set system (V, \mathcal{I}) is an independence system if

 $\emptyset \in \mathcal{I}$ (emptyset containing)

and

$$\forall I \in \mathcal{I}, J \subset I \Rightarrow J \in \mathcal{I} \quad \text{(subclusive)} \tag{12}$$

Property I2 is called "down monotone," "down closed," or "subclusive"

• Example: $E = \{1, 2, 3, 4\}$. With $\mathcal{I} = \{\emptyset, \{1\}, \{1, 2\}, \{1, 2, 4\}\}$.

(|1)

Examples and Properties	Other Submodular Defs.	Independence	Matroids
Independence	e System		

Definition 5.6.2 (independence (or hereditary) system)

A set system (V, \mathcal{I}) is an independence system if

 $\emptyset \in \mathcal{I}$ (emptyset containing)

and

$$\forall I \in \mathcal{I}, J \subset I \Rightarrow J \in \mathcal{I}$$
 (subclusive)

- Property I2 is called "down monotone," "down closed," or "subclusive"
- Example: $E = \{1, 2, 3, 4\}$. With $\mathcal{I} = \{\emptyset, \{1\}, \{1, 2\}, \{1, 2, 4\}\}$.
- Then (E, I) is a set system, but not an independence system since it is not down closed (i.e., we have {1,2} ∈ I but not {2} ∈ I).

(|1)

(12)

Examples and Properties	Other Submodular Defs.	Independence	Matroids
Independence	e Svstem		

Definition 5.6.2 (independence (or hereditary) system)

A set system (V, \mathcal{I}) is an independence system if

 $\emptyset \in \mathcal{I}$ (emptyset containing)

and

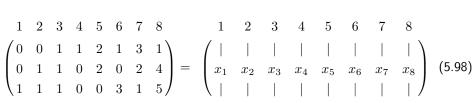

$$\forall I \in \mathcal{I}, J \subset I \Rightarrow J \in \mathcal{I}$$
 (subclusive)

(12)

(|1)

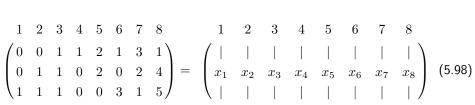

- Property I2 is called "down monotone," "down closed," or "subclusive"
- Example: $E = \{1, 2, 3, 4\}$. With $\mathcal{I} = \{\emptyset, \{1\}, \{1, 2\}, \{1, 2, 4\}\}$.
- Then (E, I) is a set system, but not an independence system since it is not down closed (i.e., we have {1,2} ∈ I but not {2} ∈ I).
- With $\mathcal{I} = \{\emptyset, \{1\}, \{2\}, \{1, 2\}\}$, then (E, \mathcal{I}) is now an independence (hereditary) system.

Examples and Properties	Other Submodular Defs.	Independence	Matroids
Independence	System		

 Given any set of linearly independent vectors A, any subset B ⊂ A will also be linearly independent.

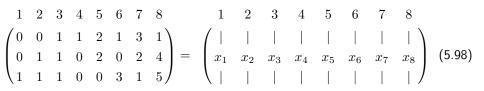

Examples and Properties	Other Submodular Defs.	Independence	Matroids
Independence	System		

- Given any set of linearly independent vectors A, any subset B ⊂ A will also be linearly independent.
- Given any forest G_f that is an edge-induced sub-graph of a graph G, any sub-graph of G_f is also a forest.

Examples and Properties	Other Submodular Defs.	Independence	Matroids

- Given any set of linearly independent vectors A, any subset $B \subset A$ will also be linearly independent.
- Given any forest G_f that is an edge-induced sub-graph of a graph G, any sub-graph of G_f is also a forest.
- So these both constitute independence systems.

Examples and Properties	Other Submodular Defs.	Independence	Matroids
11111111111			
Matroid			

Independent set definition of a matroid is perhaps most natural. Note, if $J \in \mathcal{I}$, then J is said to be an independent set.

Definition 5.6.3 (Matroid)

A set system (E, \mathcal{I}) is a Matroid if

(11) $\emptyset \in \mathcal{I}$ (12) $\forall I \in \mathcal{I}, J \subset I \Rightarrow J \in \mathcal{I}$

```
(13) \forall I, J \in \mathcal{I}, with |I| = |J| + 1, then there exists x \in I \setminus J such that J \cup \{x\} \in \mathcal{I}.
```

Why is (I1) is not redundant given (I2)?

Examples and Properties	Other Submodular Defs.	Independence	Matroids
11111111111			
Matroid			

Independent set definition of a matroid is perhaps most natural. Note, if $J \in \mathcal{I}$, then J is said to be an independent set.

Definition 5.6.3 (Matroid)

A set system (E, \mathcal{I}) is a Matroid if

(1) $\emptyset \in \mathcal{I}$ (12) $\forall I \in \mathcal{I}, J \subset I \Rightarrow J \in \mathcal{I}$ (13) $\forall I, J \in \mathcal{I}$, with |I| = |J| + 1, then there exists $x \in I \setminus J$ such that $J \cup \{x\} \in \mathcal{I}$.

Why is (I1) is not redundant given (I2)? Because without (I1) could have a non-matroid where $\mathcal{I} = \{\}$.

Definition 5.6.7 (matroid rank function)

The rank function of a matroid is a function $r: 2^E \to \mathbb{Z}_+$ defined by

$$r(A) = \max\left\{|X| : X \subseteq A, X \in \mathcal{I}\right\} = \max_{X \in \mathcal{I}} |A \cap X|$$
(5.99)

- From the above, we immediately see that $r(A) \leq |A|$.
- Moreover, if r(A) = |A|, then $A \in \mathcal{I}$, meaning A is independent (in this case, A is a self base).

A subset $A \subseteq E$ is closed (equivalently, a flat or a subspace) of matroid M if for all $x \in E \setminus A$, $r(A \cup \{x\}) = r(A) + 1$.

Definition: A hyperplane is a flat of rank r(M) - 1.

Definition 5.6.8 (closed/flat/subspace)

A subset $A \subseteq E$ is closed (equivalently, a flat or a subspace) of matroid M if for all $x \in E \setminus A$, $r(A \cup \{x\}) = r(A) + 1$.

Definition: A hyperplane is a flat of rank r(M) - 1.

Definition 5.6.9 (closure)

Given $A \subseteq E$, the closure (or span) of A, is defined by $\operatorname{span}(A) = \{b \in E : r(A \cup \{b\}) = r(A)\}.$

Definition 5.6.8 (closed/flat/subspace)

A subset $A \subseteq E$ is closed (equivalently, a flat or a subspace) of matroid M if for all $x \in E \setminus A$, $r(A \cup \{x\}) = r(A) + 1$.

Definition: A hyperplane is a flat of rank r(M) - 1.

Definition 5.6.9 (closure)

Given $A \subseteq E$, the closure (or span) of A, is defined by $\operatorname{span}(A) = \{b \in E : r(A \cup \{b\}) = r(A)\}.$

Therefore, a closed set A has span(A) = A.

Definition 5.6.8 (closed/flat/subspace)

A subset $A \subseteq E$ is closed (equivalently, a flat or a subspace) of matroid M if for all $x \in E \setminus A$, $r(A \cup \{x\}) = r(A) + 1$.

Definition: A hyperplane is a flat of rank r(M) - 1.

Definition 5.6.9 (closure)

Given $A \subseteq E$, the closure (or span) of A, is defined by $\operatorname{span}(A) = \{b \in E : r(A \cup \{b\}) = r(A)\}.$

Therefore, a closed set A has span(A) = A.

Definition 5.6.10 (circuit)

A subset $A \subseteq E$ is circuit or a cycle if it is an inclusionwise-minimal dependent set (i.e., if r(A) < |A| and for any $a \in A$, $r(A \setminus \{a\}) = |A| - 1$).

Examples and Properties	Other Submodular Defs.	Independence	Matroids
			111111111111111
Matroids by	bases		

In general, besides independent sets and rank functions, there are other equivalent ways to characterize matroids.

Theorem 5.6.11 (Matroid (by bases))

Let E be a set and \mathcal{B} be a nonempty collection of subsets of E. Then the following are equivalent.

- **(**) \mathcal{B} is the collection of bases of a matroid;
- 2 if $B, B' \in \mathcal{B}$, and $x \in B' \setminus B$, then $B' x + y \in \mathcal{B}$ for some $y \in B \setminus B'$.
- **③** If $B, B' \in \mathcal{B}$, and $x \in B' \setminus B$, then $B y + x \in \mathcal{B}$ for some $y \in B \setminus B'$.

Properties 2 and 3 are called "exchange properties."

Examples and Properties	Other Submodular Defs.	Independence	Matroids
			111111111111111
Matroids by	bases		

In general, besides independent sets and rank functions, there are other equivalent ways to characterize matroids.

Theorem 5.6.11 (Matroid (by bases))

Let E be a set and \mathcal{B} be a nonempty collection of subsets of E. Then the following are equivalent.

() \mathcal{B} is the collection of bases of a matroid;

2 if $B, B' \in \mathcal{B}$, and $x \in B' \setminus B$, then $B' - x + y \in \mathcal{B}$ for some $y \in B \setminus B'$.

③ If $B, B' \in \mathcal{B}$, and $x \in B' \setminus B$, then $B - y + x \in \mathcal{B}$ for some $y \in B \setminus B'$.

Properties 2 and 3 are called "exchange properties." Proof here is omitted but think about this for a moment in terms of linear spaces and matrices, and (alternatively) spanning trees.

Examples and Properties	Other Submodular Defs.	Independence	Matroids
Matroids by c	circuits		

A set is independent if and only if it contains no circuit. Therefore, it is not surprising that circuits can also characterize a matroid.

Theorem 5.6.12 (Matroid by circuits)

Let E be a set and C be a collection of subsets of E that satisfy the following three properties:

- **1** (C1): $\emptyset \notin C$
- (C2): if $C_1, C_2 \in \mathcal{C}$ and $C_1 \subseteq C_2$, then $C_1 = C_2$.
- **3** (C3): if $C_1, C_2 \in \mathcal{C}$ with $C_1 \neq C_2$, and $e \in C_1 \cap C_2$, then there exists a $C_3 \in \mathcal{C}$ such that $C_3 \subseteq (C_1 \cup C_2) \setminus \{e\}$.

Matroids by circuits			

Several circuit definitions for matroids.

Theorem 5.6.13 (Matroid by circuits)

Let E be a set and C be a collection of nonempty subsets of E, such that no two sets in C are contained in each other. Then the following are equivalent.

• C is the collection of circuits of a matroid;

2) if $C, C' \in C$, and $x \in C \cap C'$, then $(C \cup C') \setminus \{x\}$ contains a set in C;

3 if $C, C' \in C$, and $x \in C \cap C'$, and $y \in C \setminus C'$, then $(C \cup C') \setminus \{x\}$ contains a set in C containing y;

Again, think about this for a moment in terms of linear spaces and matrices, and spanning trees.

Matroids

Matroids by submodular functions

Theorem 5.6.14 (Matroid by submodular functions)

Let $f : 2^E \to \mathbb{Z}$ be a integer valued monotone non-decreasing submodular function. Define a set of sets as follows:

$$C(f) = \left\{ C \subseteq E : C \text{ is non-empty,} \\ \text{ is inclusionwise-minimal,} \\ \text{ and has } f(C) < |C| \right\}$$
(5.100)

Then C(f) is the collection of circuits of a matroid on E.

Inclusionwise-minimal in this case means that if $C \in C(f)$, then there exists no $C' \subset C$ with $C' \in C(f)$ (i.e., $C' \subset C$ would either be empty or have $f(C') \geq |C'|$). Also, recall inclusionwise-minimal in Definition 5.6.10, the definition of a circuit.
